Approximate MESA remeshing: $\Delta t = \Delta r/(c_s + |v|)$

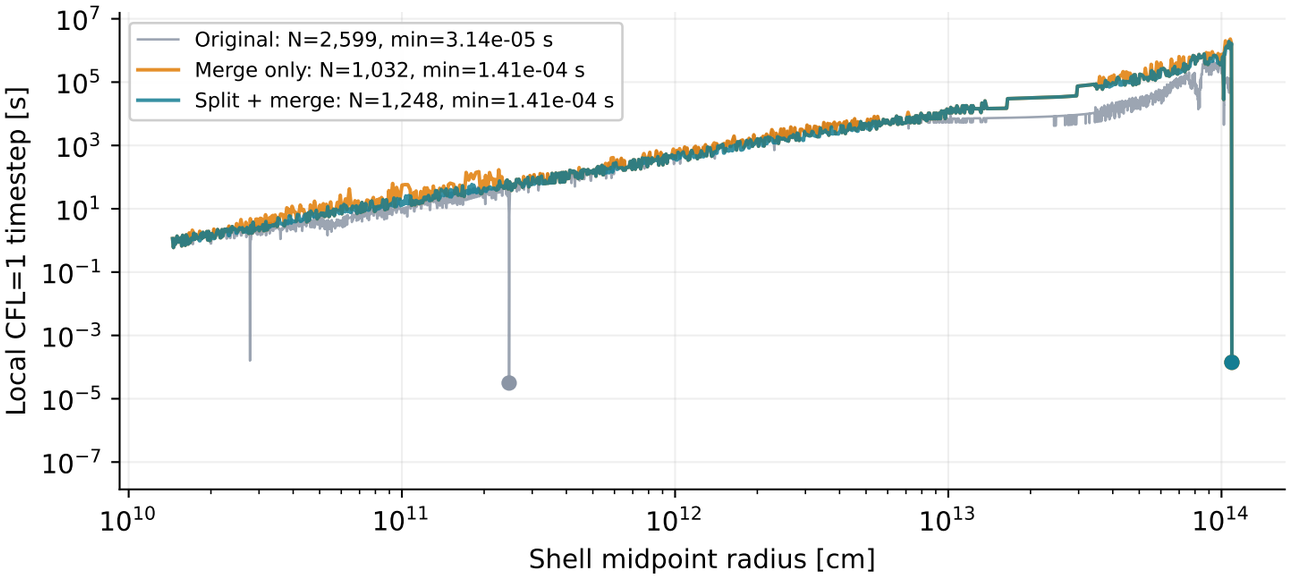

Whole profile (4,147 input cells)
Log-radius target: 1,200

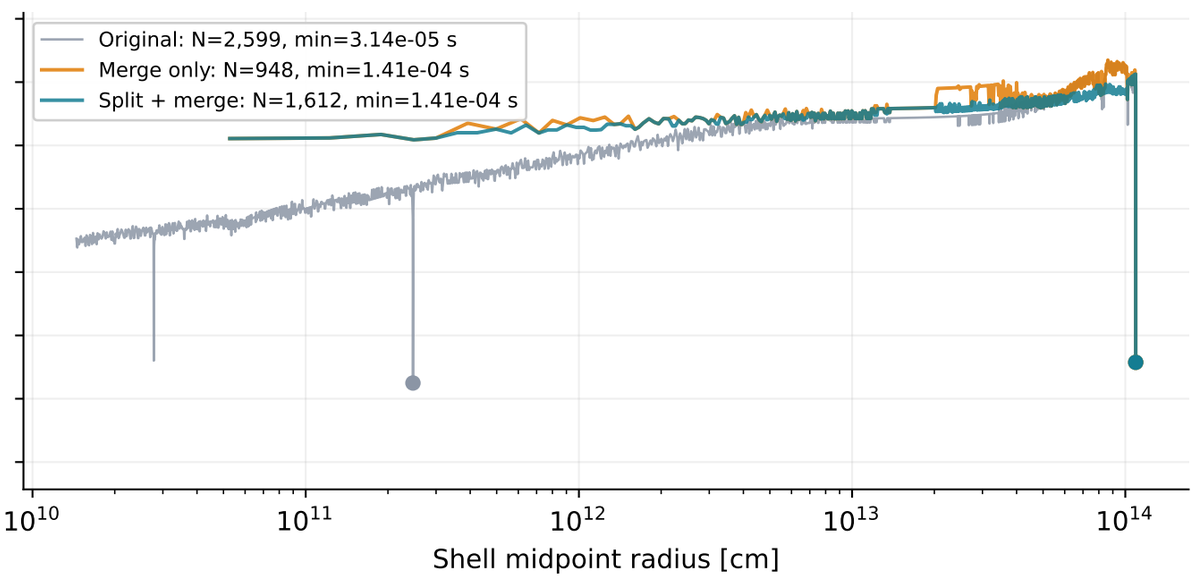

Whole profile (4,147 input cells)
Linear-radius target: 1,600

After inner ~4 Msun cut (2,599 input cells)
Log-radius target: 1,200

After inner ~4 Msun cut (2,599 input cells)
Linear-radius target: 1,600

Dots mark global minima. Widths use logR shell faces for every curve. Sound speed is inherited from the retained cell; no EOS reconstruction.
Meshes are iterated to a fixed point; these are profile diagnostics, not timestep measurements from a MESA or FLARE run.
